

SPIDER: Independent Fission Product Yields from 0.5-20 MeV

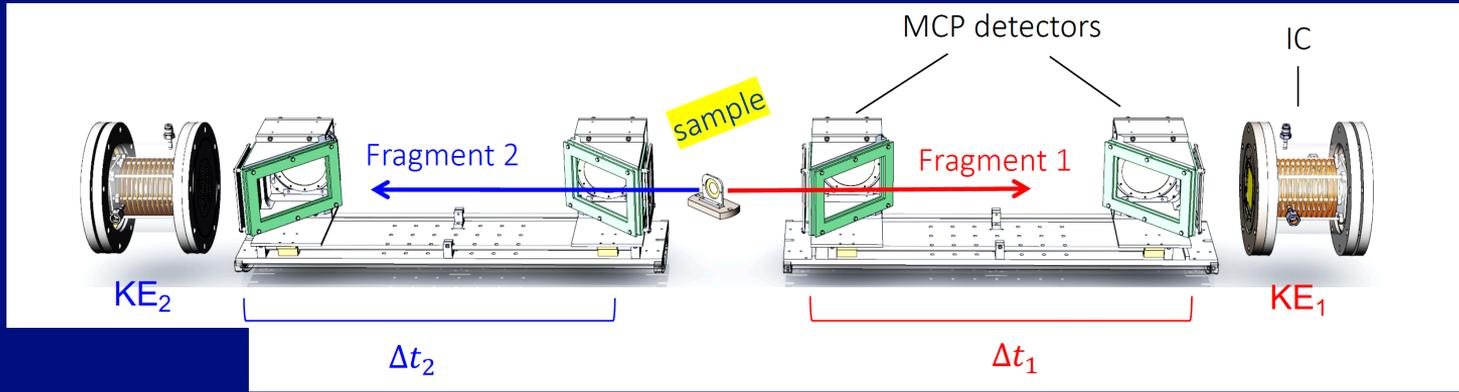

Jack Winkelbauer

LANL P3 Low Energy Nuclear Physics

March 4, 2022

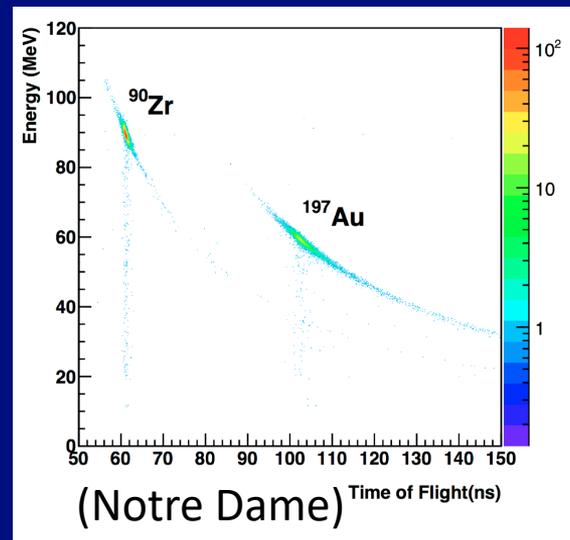

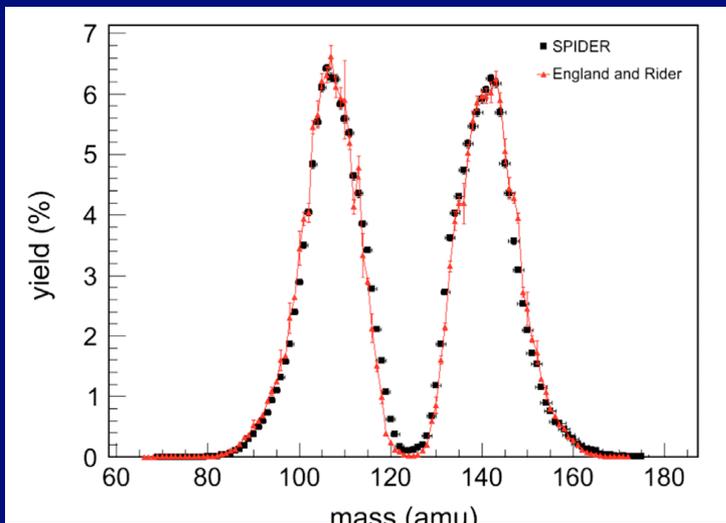

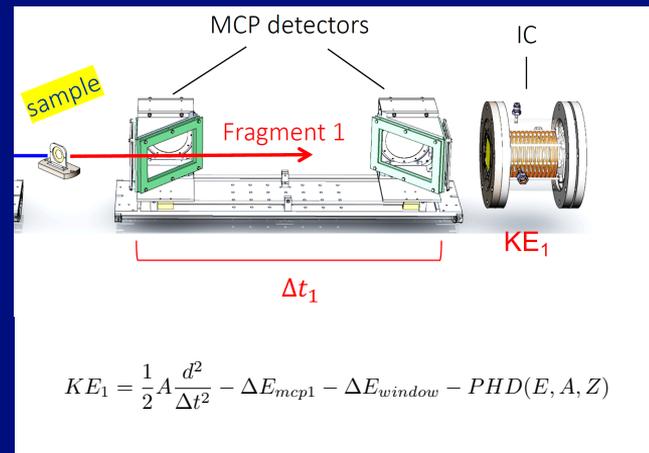

2E-2V FPY's with SPIDER

- 2E-2v: $\text{Mass} \propto (E) \cdot (\text{TOF})^2$
- Goal <1 AMU mass resolution, fast neutrons, well-understood uncertainty/covariance
- Challenges: resolution, calibration, scalability

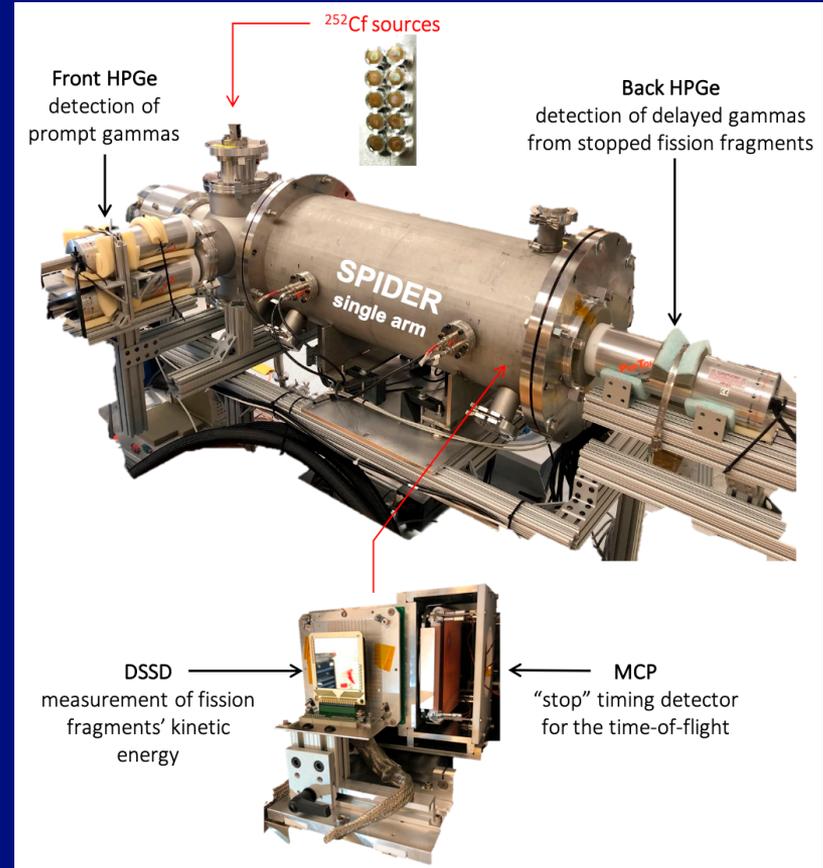

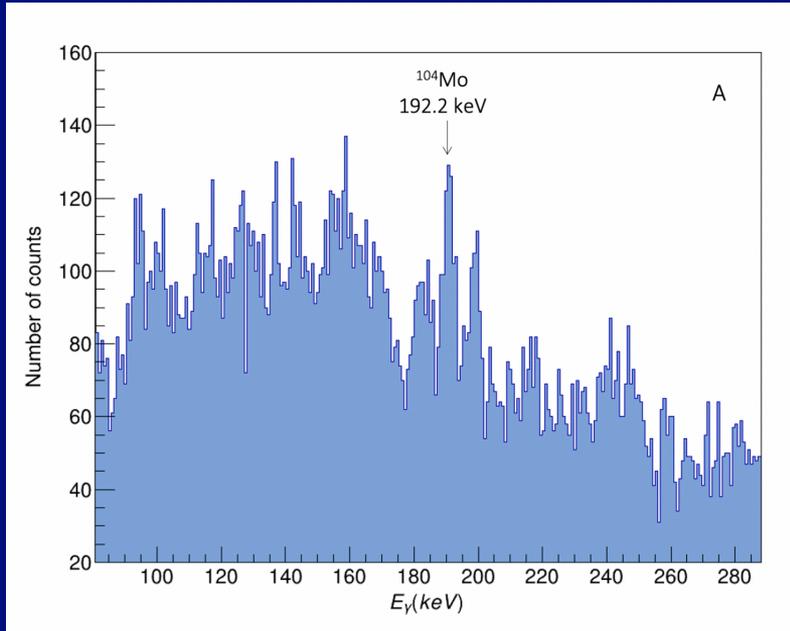

SPIDER - Calibration Issues

- Unknown calibration, energy loss, and PHD
- Calibration depends on A,Z,E
- Calibration at external facility?
- Calibration with ^{252}Cf ?

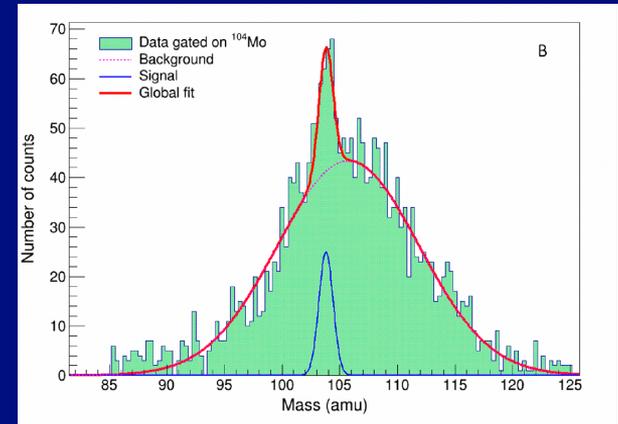

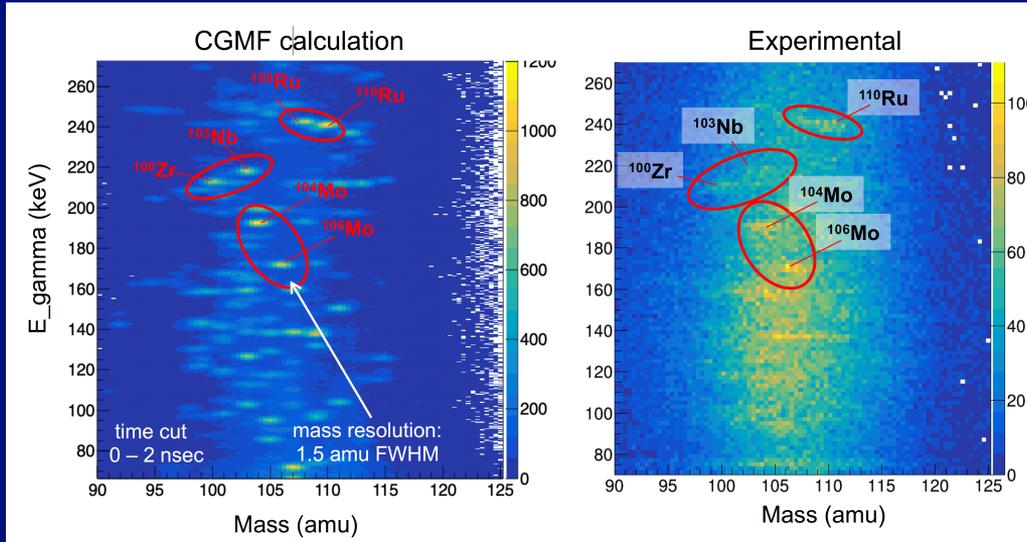

SPIDER - Calibration Issues

- Gamma-ray tagging with hpGe
- Potentially calibration and resolution

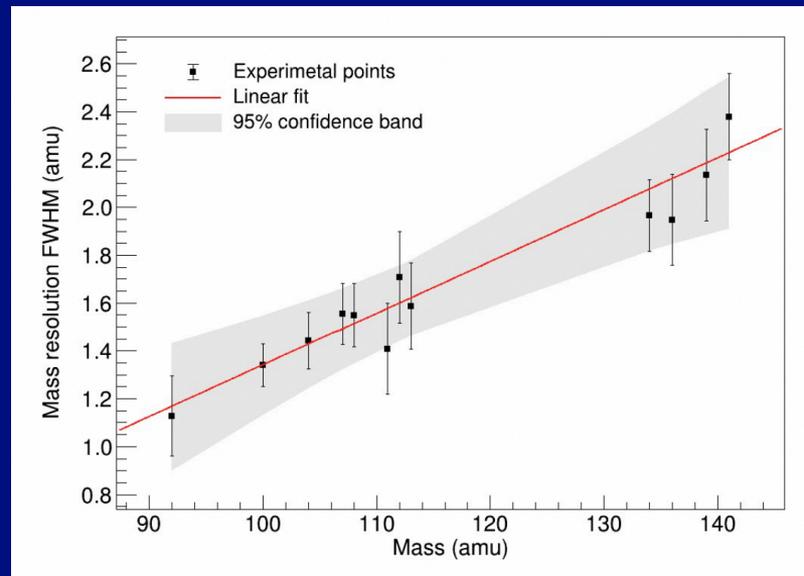

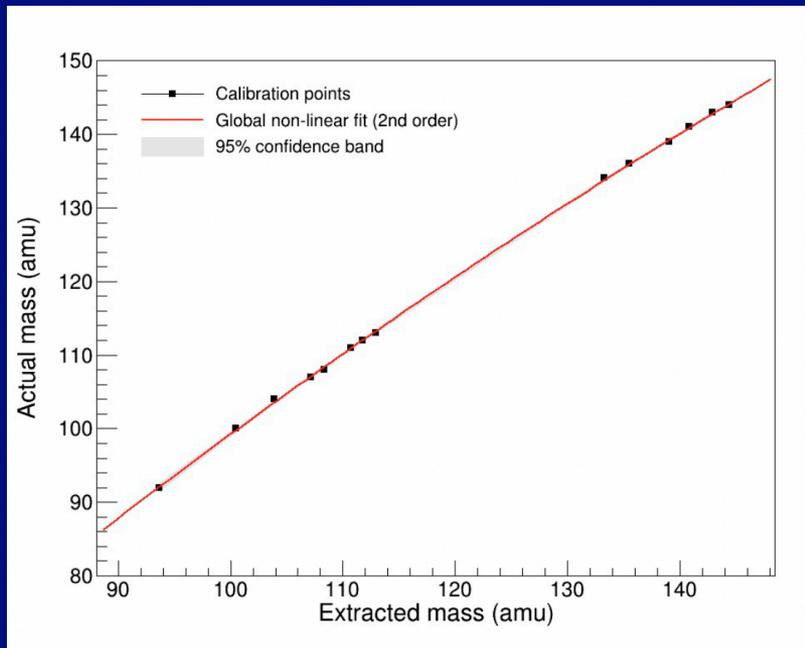

SPIDER - Calibration Issues

- Unknown calibration, energy loss, and PHD
- Gamma-ray tagging with hpGe
- Resolution with Si DSSD ~ 1.4 FWHM

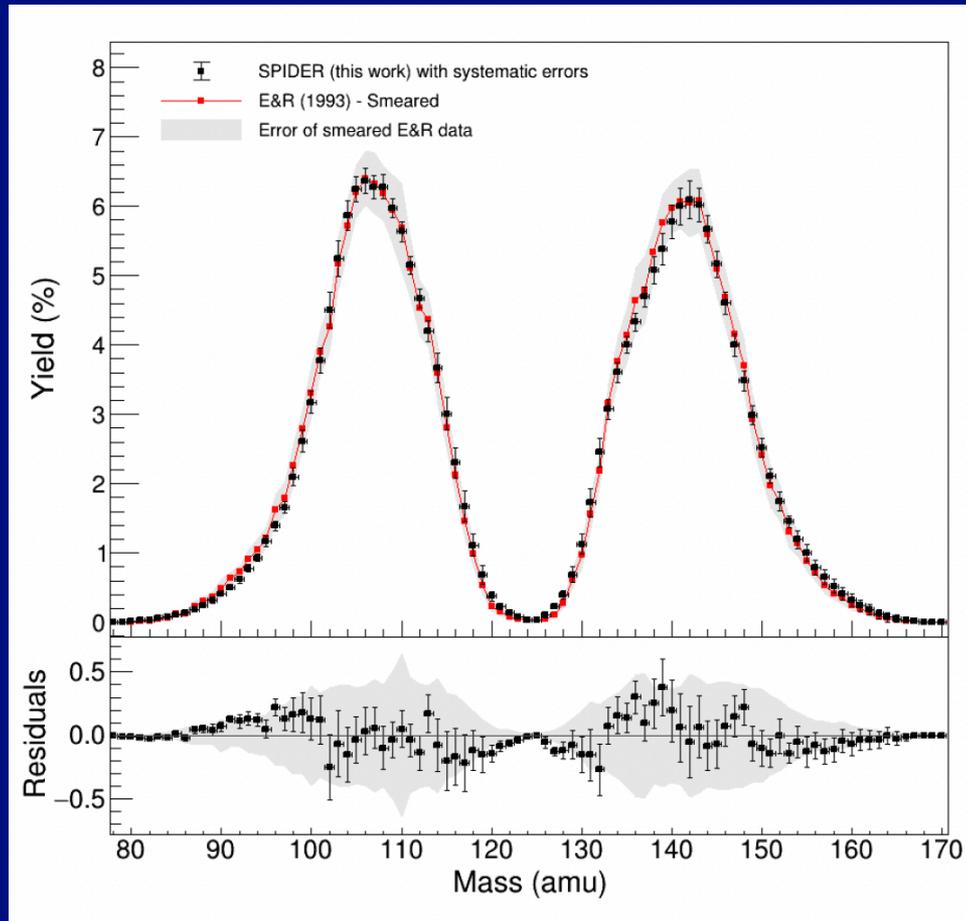

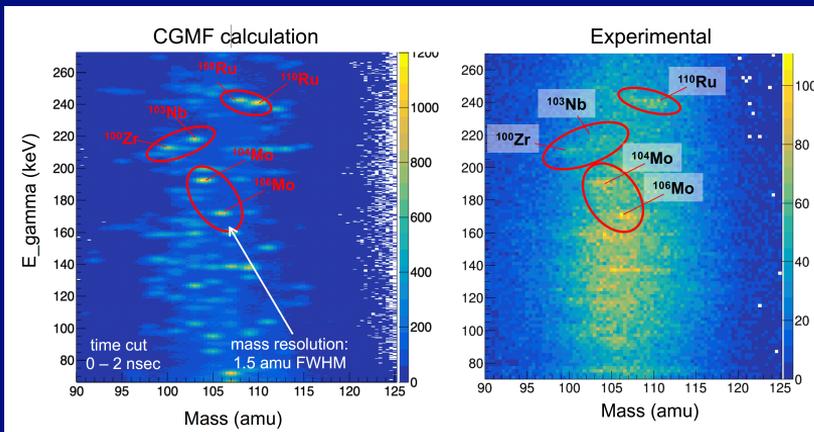

SPIDER - Calibration and Resolution(!)

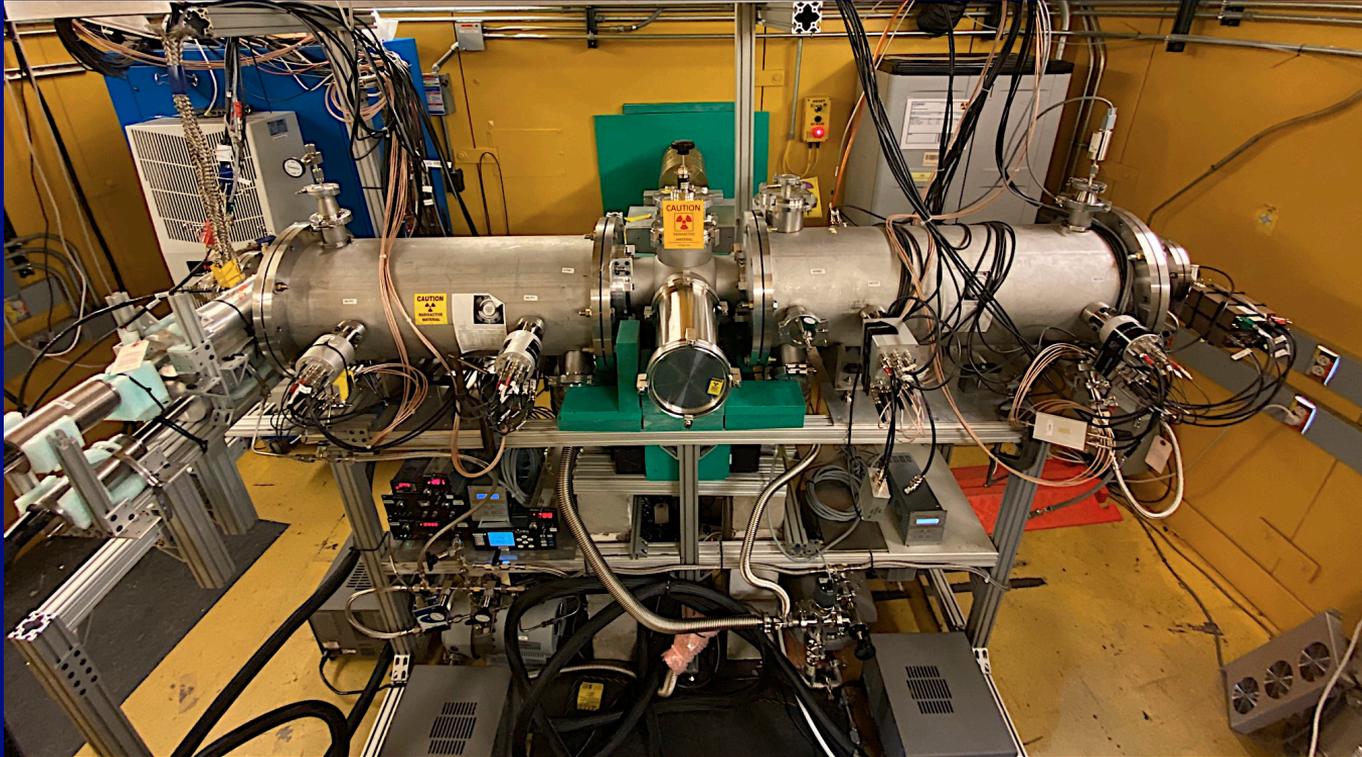

SPIDER - Progress

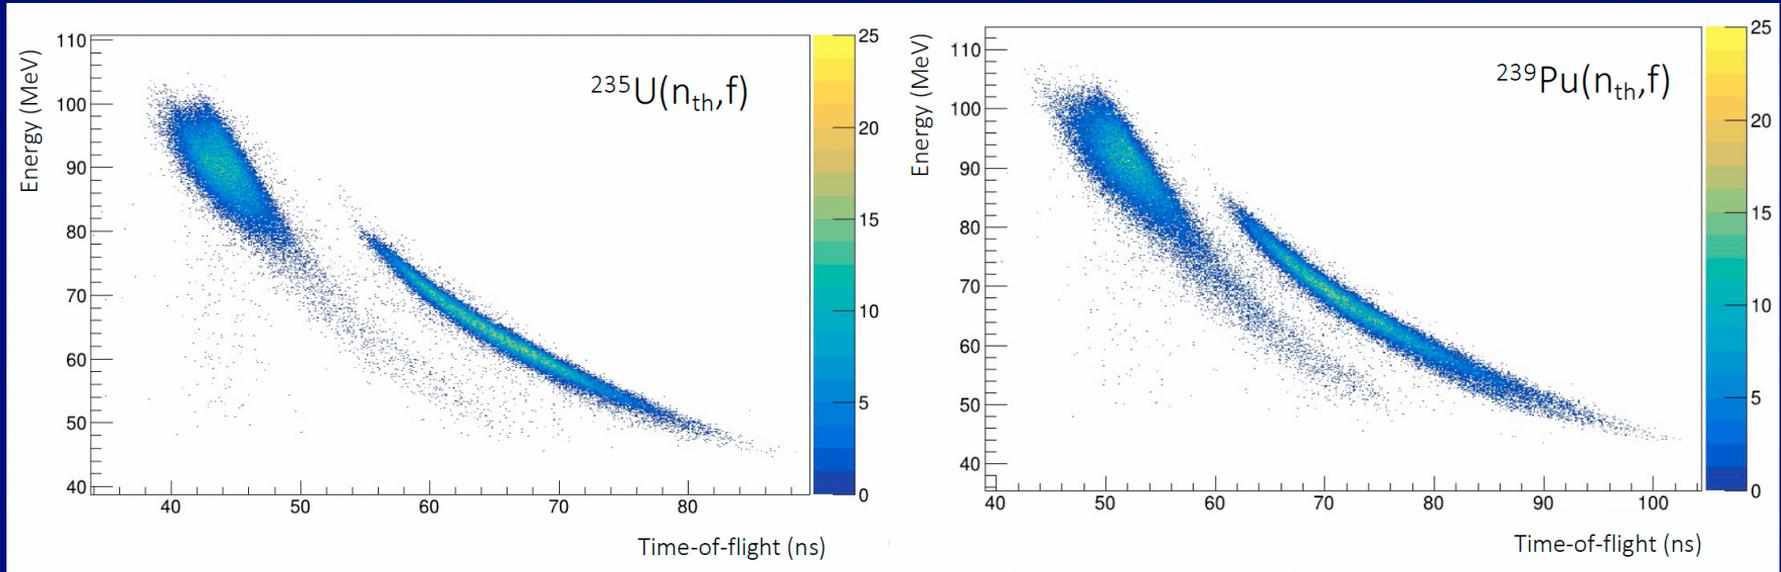

- Calibration informs systematic error in FPY's
- Resolution informs covariance
- Gamma spectra with calibrated mass, $^{252}\text{Cf}(sf)$

SPIDER - Progress at Lujan Center

SPIDER - Progress at Lujan Center

Future - MegaSPIDER

- Scalability: Need 16 arms
- IFPY's up to 20 MeV at WNR
- Measurement per beam year
- Analyzing IC vs. Si DSSD design choice

SPIDER People

- Current SPIDER team: J. Winkelbauer (PI), S. Mosby (PL), P. Gastis (PD), C. Prokop (S), S. Kuvin (S)
